

SINGLE-HANDED BLEED-SCREWS

Bleeding the brakes, or the clutch, has traditionally required two pairs of hands, which is fine then there is an assistant to be had but (genetic engineering apart) it's not always that easy. Which is where single-handed bleeds-crews come in. These clever little devils take the place of conventional bleed-screws but have a spring-loaded brass valve which does away with all that "up-down-up-down" nonsense when you need to bleed the system.

Under normal operating conditions the valve is screwed down and the bleed screw is sealed. When you need to bleed the system all you have to do is loosen the screw half a turn or so and connect the outlet to a suitable container. Then press the brake (or clutch) pedal up and down to expel air and fluid - the spring-loaded valve stops the fluid and air from being drawn back into the system. When you're happy that all the air has been expelled, you tighten the screw and that's the job done. Bleeding simple.

Single handed bleed-screw come in various sizes, but all are the same price - **£16.00 per pair.**

Sizes:

1/4UNF	M6x1.00
5/16UNF	M7x1.00
3/8UNF	M8x1.00
7/16UNF (20tpi)	M10x1.00
7/16UNF (24tpi)	M10x1.25
	M10x1.5
